

EUNICE MAPONG DONFACK

BUSINESS ANALYST | PROCESS IMPROVEMENT | DIGITAL TRANSFORMATION

nice55kloe@gmail.com | eunice-mapong-portfolio.vercel.app

French: Native | English: Professional working proficiency

PROFESSIONAL SUMMARY

Bilingual French/English business analyst with 7+ years across insurance, public sector and IT services delivery, working in requirements elicitation, functional specification and user stories, business process analysis, solution validation and post-deployment support. I stay accountable for a requirement's integrity from the moment it is raised until it is proven correct in production — not only until the spec is signed off. Workshops, interviews and direct observation of how the work is actually done are where I find the real requirement behind the stated one; a software development background then lets my specifications account for how each deliverable must behave, including dependencies between features, what an endpoint returns, and which legacy behaviours must survive a migration untouched. Because I stay involved through UAT design, go-live and early-life support, gaps between what was specified and what was actually built surface while they are still cheap to fix.

WHAT I BRING

- Finding the real requirement rather than the stated one — observing how work is actually done, reading the artefacts people produce, and noticing where practice and documentation diverge.
- Specifying at the analyst's altitude with technical precision — system interactions, integration points, acceptance criteria and the legacy behaviours a migration must preserve.
- Protecting the outcome after handoff — UAT design, anomaly diagnosis, go-live support and early-life defect tracking, including recognising a reported bug as a requirements defect.

CORE COMPETENCIES

Business & Requirements Analysis

Elicitation; workshops; user stories; acceptance criteria; requirements documentation

API & System Integration

System interactions; interface requirements; interoperability; API/microservice validation; Postman

Technology Fluency

Azure DevOps; Microsoft 365; GitHub; C#/.NET; Azure; SQL Server; RBAC; cloud-native concepts

Process & Workflow Analysis

AS-IS/TO-BE; operational workflows; UML; flow and sequence diagrams; gap/impact analysis

Solution Validation & Testing

Functional and integration test design; test cases; UAT coordination; traceability

Governance & Strategy

ITIL 4; IT diagnostics and audits; strategic roadmapping; recommendation frameworks

Delivery & Stakeholder Support

Agile/Scrum; backlog refinement; estimation support; risk/dependency awareness

Operational Support

Go-live and early-life support; defect diagnosis; knowledge transfer; training

Communication

Bilingual FR/EN; client-facing documentation; validation workshops; executive synthesis

PROFESSIONAL EXPERIENCE

LGS, an IBM Company | Jun 2023 – Present

IT Consultant | Business Analysis — AI-enabled consultant profile management solution (2025)

Internal initiative using AI to standardise consultant profiles and accelerate public-sector RFP responses.

- Framed the analysis from the buyer's side, reading across government tenders to identify the roles, skills, technologies, experience levels and selection criteria that decide outcomes.
- Surfaced a consistent mismatch: tenders expect tasks framed to a defined pattern, deliverables produced and methodologies used — items consultant CVs often did not carry, or did not frame the way evaluators expected to read them.
- Aligned stakeholders in validation workshops on how a profile is described and the rules by which a tender requirement and a consultant capability count as a match.

- Created shared clarity by documenting the business rules, functional requirements and framework direction, making a CV update a defined activity rather than an individual interpretation.
- Protected adoption by standardising 200+ consultant profiles and producing training and communication material; contributed to a ~50% reduction in the time taken to select and update CVs.

Tools & technologies: Functional analysis, business rules, reference data and taxonomies, AI tools, Microsoft 365, Agile/Scrum

LGS, an IBM Company | Jun 2023 – Present

IT Consultant | Business Analysis | Software Developer — Modernisation of a large insurance platform

Migration of a legacy VB.NET insurance application used by 25,000+ agents and brokers to a cloud-native Azure web platform.

- Framed and clarified 100+ user stories to align business needs, legacy system behaviours, acceptance criteria and development scope.
- Surfaced a dependency on an unfinished API by tracing a story's functional behaviour through to the endpoints it would call; raised early, it triggered re-prioritisation and direct coordination with the owning team before a sprint was lost.
- Ran a dedicated kick-off for every assigned story with the subject-matter expert or customer-side analyst who could answer for it, removing ambiguity before code rather than discovering it in testing.
- Created shared clarity on legacy system interactions through flow and sequence diagrams, preserving the figures and responses returned to agents during product illustrations.
- Protected delivery outcomes through API and microservice validation with Postman, functional traceability, UAT, and defect tracking through to resolution after go-live.
- Maintained functional documentation as code (Markdown) to keep requirements, decisions and system behaviour consistent across delivery teams.

Tools & technologies: Azure, APIs, microservices, Postman, Azure DevOps, C#, .NET Core, SQL Server, Draw.io, GitHub, Agile/Scrum

Sécurité Électronique (SECEL) Sarl | 2017 – 2022

Business/Functional Analyst — Strategic IT master plan, Communauté Urbaine de Douala (Cameroon)

Four-year IT master plan covering applications, infrastructure, network, databases, security, governance and processes.

- Prepared audit plans and coordinated engagement with approximately 80 stakeholders through interviews, questionnaires, direct observation and document analysis.
- Analysed and validated the AS-IS models against what the fieldwork actually found, so the gap analysis measured the distance from the real current state rather than an idealised one.
- Contributed to consolidating 100+ deliverables — framing notes, audit reports, execution plans and synthesis documents — into material an executive could decide from.
- Documented approximately 100 strategic project recommendations, all retained by the organisation; the four-year roadmap was adopted and used to prioritise IT investment and launch modernisation work.

Tools & technologies: IT diagnostic and assessment, gap analysis, strategic roadmapping, IT governance, stakeholder management

Sécurité Électronique (SECEL) Sarl | 2017 – 2022

Business/Functional Analyst — School excellence awards management solution (2018)

Automation of a paper and Excel award process for an international child-welfare NGO.

- Framed the real problem through workshops, interviews, direct user observation and analysis of paper and Excel artefacts — finding the same student data held in several hand-updated files with no version control, which no one had raised as a problem.
- Created shared clarity by translating eligibility rules, data sources, validation steps and ranking criteria into functional requirements, business rules and acceptance criteria traceable through to tests; modelled the business processes in UML.
- Protected the outcome by structuring the functional and integration test plan and coordinating UAT end to end; diagnosed a reported defect as an uncaptured requirement for the generated PDF certificates and brought stakeholders together to scope the correction.
- Supported go-live through the first live award cycle and traced a volume-related slowdown to the architecture rather than to usage, scoping it into a second project phase; trained three end users.

- Reduced production of results and rankings from more than ten days to approximately two hours, with every eligible student's ranking traceable back to the inputs that produced it.

Tools & technologies: Elicitation, business rules, functional specifications, UML, requirements traceability, UAT coordination, C#, SQL Server, Agile/Scrum

Sécurité Électronique (SECEL) Sarl | 2017 – 2022

Business/Functional Analyst — ITIL 4 incident and change management realignment (2020)

Process optimisation across a multi-site support organisation where practised and documented processes had diverged.

- Framed objectives, requirements and optimisation priorities in a requirements workshop with business and IT stakeholders.
- Established the AS-IS from what teams actually did rather than from the process documents, identifying operational irritants, ITIL 4 compliance gaps, governance risks from unclear ownership, and standardisation opportunities across sites.
- Formulated more than ten improvement recommendations, all accepted by the client and translated into an optimisation roadmap.
- Created shared clarity by modelling the TO-BE processes with explicit roles, steps, control points and monitoring indicators; target processes were approved without major modification and presented to the owners who would run them.

Tools & technologies: Business process analysis, AS-IS/TO-BE modelling, gap analysis, ITIL 4, IT governance, stakeholder validation

ADDITIONAL RELEVANT EXPERIENCE

- **Digital identity and biometric registration platform:** took over functional analysis after the lead developer's departure; specified interoperability with fingerprint readers, smart cards and tablets; authored 20+ functional test cases and coordinated UAT across eight iterations.
- **Critical infrastructure modernisation (NetScaler ADC):** documented functional and technical specifications for a platform serving 2,000+ internal users and partners; executed 20+ acceptance tests and followed residual issues through four weeks of post-deployment stabilisation.
- **Education-management platform modernisation:** interviews, AS-IS analysis and gap assessment for a system supporting approximately 2,000 students; contributed to UML design and MVC/.NET modernisation.
- **Healthcare and operational software solutions:** requirements definition, end-to-end testing, user documentation, training and deployment support for medical-centre and transport-management applications.
